SE050 breakout, top view, scale 1:1. Print at 100%, no fit to page.

Check: bar below = 50 mm; comb below = 8 holes at 2.54 mm pitch.

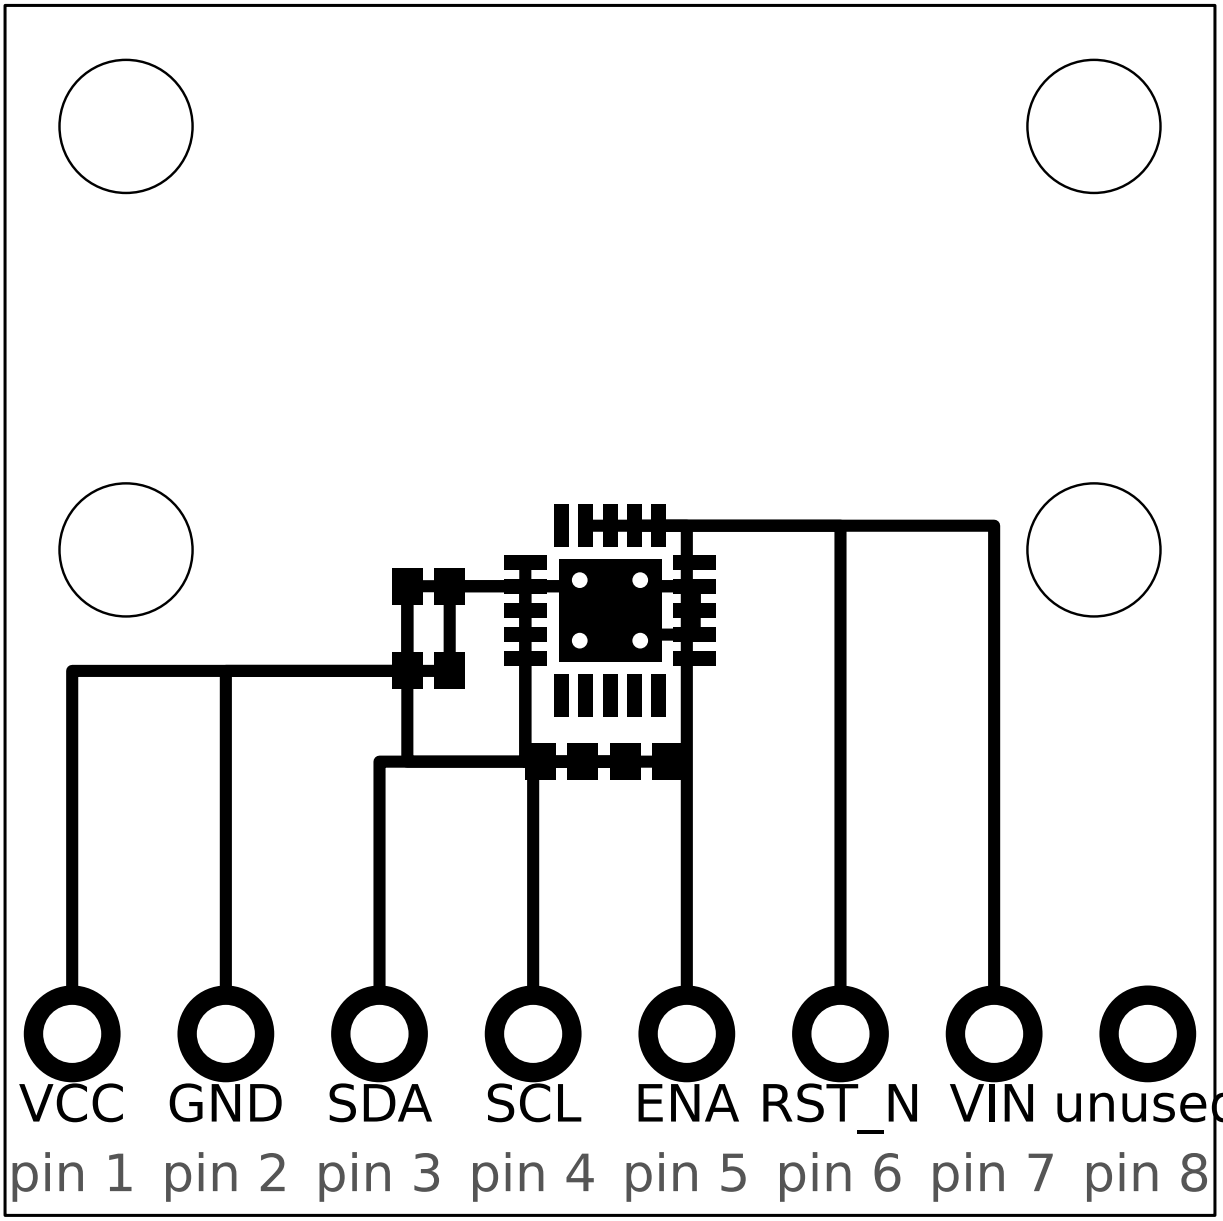

0 mm 10 mm 20 mm 30 mm 40 mm 50 mm

Top copper

SE050 breakout, top view, 8:1, file SE050_breakout.GTL

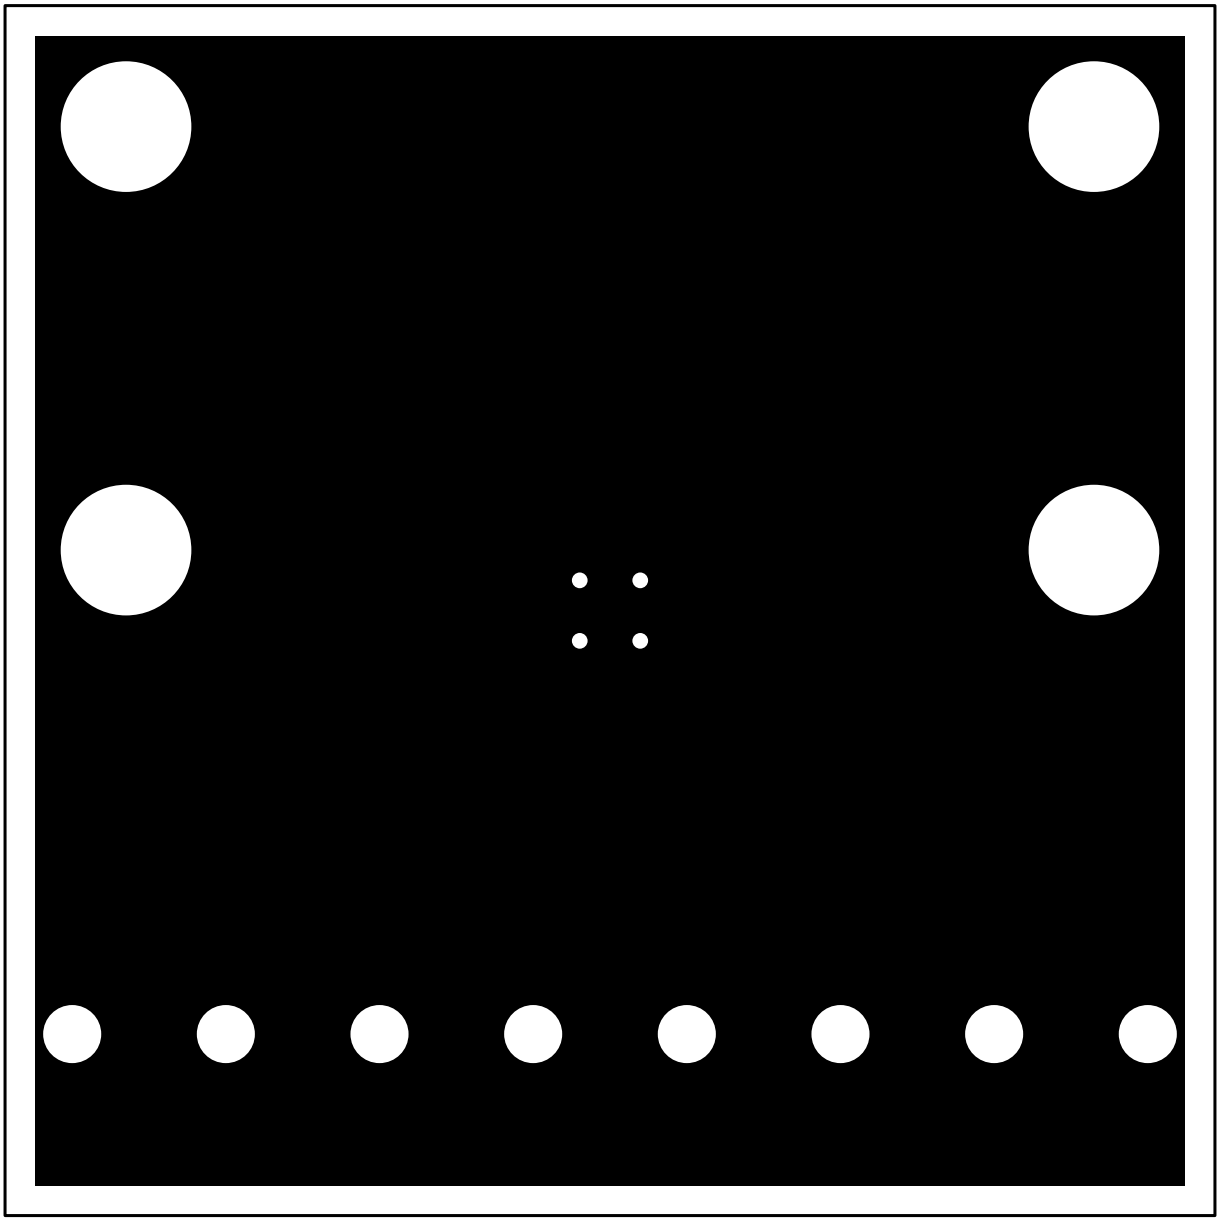

The top copper layer: the tracks (piste) that carry signals, and the pads where parts are soldered. Each track starts at a header pin at the bottom and ends at a pad on the chip or a small part. Only this layer is shown.

Bottom copper

SE050 breakout, top view, 8:1, file SE050_breakout.GBL

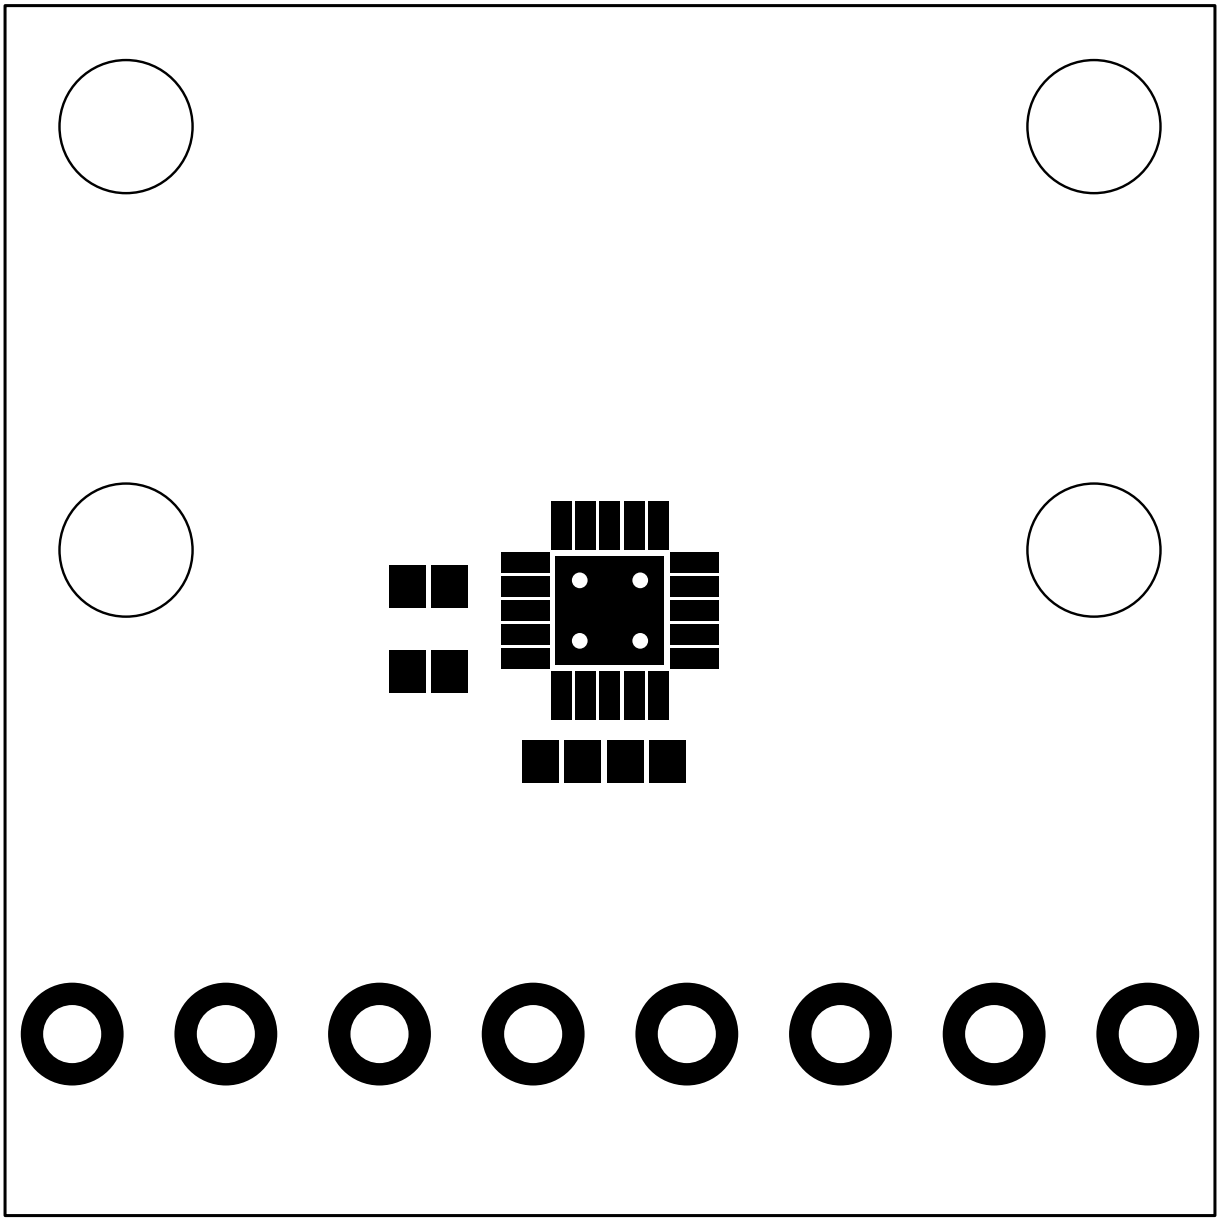

The bottom copper layer: one ground plane covering the board with a 0.5 mm margin, plus the four small vias that connect it to the top. There are no tracks on this side.

Top solder mask

SE050 breakout, top view, 8:1, file SE050_breakout.GTS

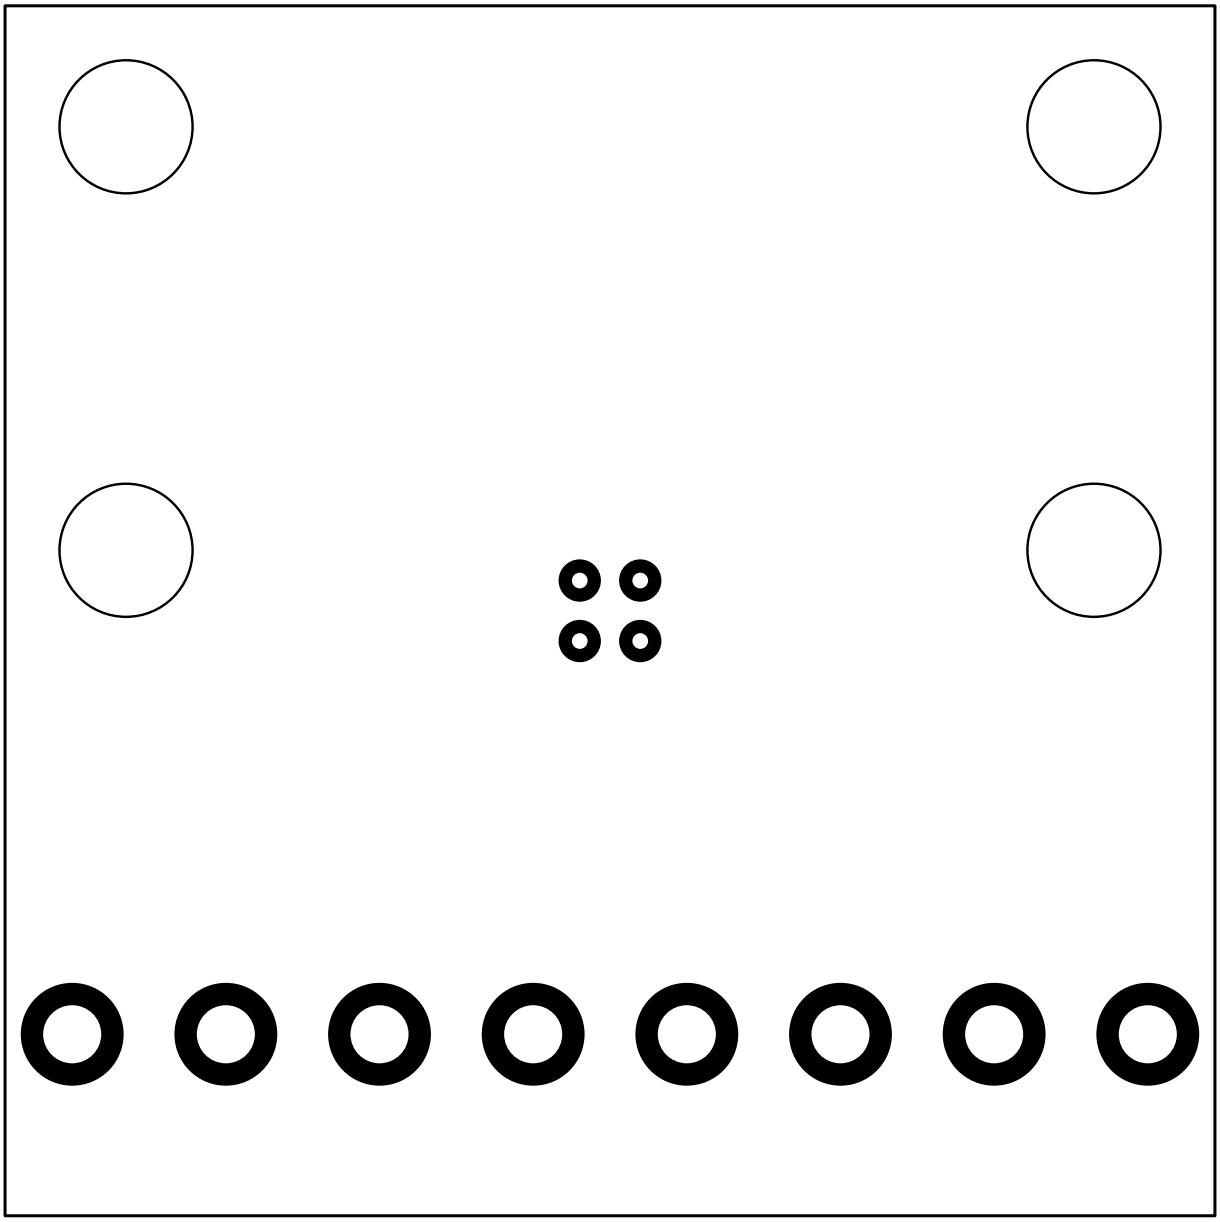

The top solder mask openings: black is where the green lacquer is removed so the pads are bare for soldering. Everything not black stays covered.

Bottom solder mask

SE050 breakout, top view, 8:1, file SE050_breakout.GBS

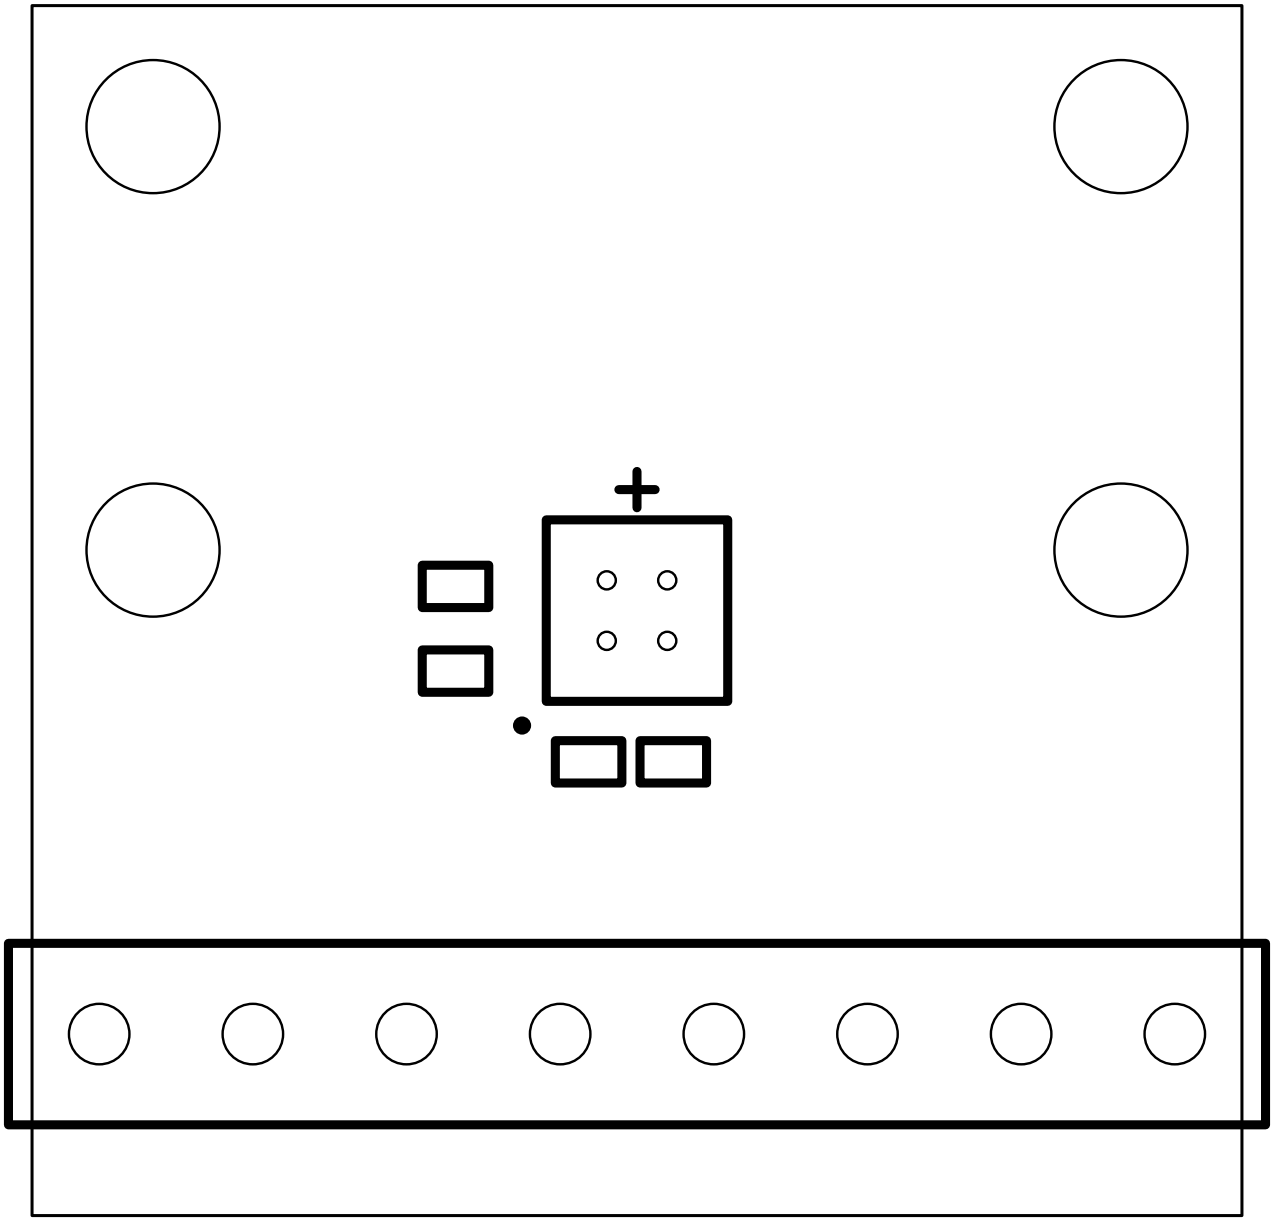

The bottom solder mask openings (black = bare copper). Here, only the vias.

Top silkscreen

SE050 breakout, top view, 8:1, file SE050_breakout.GTO

The printed white markings on the top: the chip outline, pin 1 dot and part outlines. They carry no electrical meaning.

Drills and outline

SE050 breakout, top view, 8:1, file SE050_breakout.DRL, .GKO

The board edge and every hole: 4 mounting holes (2.2 mm), 8 header holes (1.0 mm), 4 vias (0.3 mm).
